

ANNOTATION

Work program of industrial practice "Practice in emergency medical manipulation"

Speciality	05/31/01 General medicine
Number of credits	In accordance with the RUP
Interim certification form	In accordance with the RUP

1. The purpose of the practice: is to in-depth study of knowledge about emergency conditions and mastery of basic skills, methods and algorithms for providing emergency medical care in emergency conditions at the prehospital stage. Emergency conditions can develop suddenly in anyone. Delay in providing emergency medical care can lead to various serious consequences for the patient's health, including his rapid death. The doctor must know the basic methods of diagnosing emergency conditions and master first aid techniques. The primary care doctor, by virtue of his profession, is often the first one who can help the patient. He must not only be fluent in the methods of providing assistance, but also be able to provide assistance to prevent the serious consequences of suddenly developing life-threatening conditions.

2. Brief summary of the practice.

The practice is aimed at developing skills in conducting a clinical examination in emergency conditions at the prehospital stage; determining the severity of the patient's condition and the existing leading syndrome; carrying out differential diagnosis of diseases; working with portable diagnostic equipment; provision of syndromic emergency medical care; determining indications for patient hospitalization; conducting an examination of a patient in emergency conditions at the prehospital stage; ability to evaluate the effectiveness of emergency medical care; ability to carry out pharmacotherapy at the prehospital stage; ability to monitor at all stages of prehospital care; ability to organize the work of a team to provide emergency medical care to patients; teaching patients self-help; knowledge of the principles of providing emergency medical care for terminal conditions at the prehospital stage; studying the rules for filling out medical documentation; studying the basic sanitary-hygienic and anti-epidemic measures carried out during the provision of emergency medical care at the prehospital stage.
